

HOW TO GET RID OF GAS SMELL FROM STOVE

RUN THE VENT HOOD

Install a range hood to pull and filter out gaseous odors before they spread. Keep it running for 5-10 minutes after finishing cooking.

LIGHT BURNERS

Burning the gas will use up small leaks from fittings and limit how much escapes into the room untreated.

CLEAN THE BURNERS

Wipe away old caked-on food and grime around the burners that can create gross smells when heated.

REPLACE RUBBER HOSE

Old cracked gas connector hoses can release methane fumes. Swap in a new stainless steel connector hose.

USE SOAPY WATER

Apply soapy water with a brush around hoses and fittings to bubble-test for larger leaks.

INSTALL GAS DETECTOR

A methane or propane gas detector can alert you to dangerous concentrations.

SCHEDULE AN INSPECTION

If smells persist, contact the gas company or plumber to inspect for leaks within the lines or stove itself.
